The Bingham Canyon copper mine in Utah is the world's largest human-made excavation. Like most large open-pit mines, it uses a baseline of safety to reduce the risk and enable heavy equipment to reach mineral-bearing rock! Vertical shafts are used to transport material to the surface. Horizontal shafts are used to transport material to the surface.

Open-pit mining is a common method for extracting minerals. It involves creating a large, shallow pit in the ground. This method is used for a variety of minerals, including copper, iron, and gold. The process is often more cost-effective than underground mining, but it can have significant environmental impacts.
