

slot tiki torch

Ontology with a set of individual instances and classes constitute a knowledge base.
How to describe a concept in the domain? A class can have subclasses that represent concepts.
These are more specific than the superclasses. Slots describe the properties of a class and participate in an ontological (protg-stanford/edu) -

units with ontology. A slot type defines how the slot will be used.
For information on an identifier, see the documentation.
The bot defines the information that should be looked for when retrying to find a slot in the utterance.
